Alright now I need your help to figure out how to make an over the air translator with the use of AI. I want to be able to talk to those who don't speak English as I work at a call center

Absolutely — here's how to design a **simple, realistic, over-the-air AI translator** you can use at a **call center** to talk with customers who don't speak English.

I'll break it into **3 practical levels**, depending on how sophisticated you want the setup to be.

Then I'll give you **hardware, software, and workflow** so it's something you can actually *use in real calls*.

★ Goal

You speak English → customer hears their language

Customer speaks → you hear English

All in real-time (or close to it).

■ LEVEL 1 — Easiest & Cheapest (Phone + Earbud + PC)

This is the fastest way to get working today.

✓ You need:

- Your **PC** (for the call system)
- Your **smartphone**
- A single **Bluetooth earbud** in one ear
- An **AI translator app** (best options below)
