

- A. Something you can start using tomorrow
- B. A professional setup for call center use
- C. Help building your own translator app (I can write the code/UI)

Tell me the level and I'll build the exact system for you.

find specific grammar, spelling, punctuation, and sentence structure mistakes. Show me specific section that need to be improved: Develop a new product idea for "solving everyday pain" or "increasing pleasure." Describe the everyday pain (pleasure). Now describe how your product idea solves (increases) the pain (pleasure).

Headset translator

As someone who works at a call center, I speak to many different people every day. Many come from different places and have diverse backgrounds. I speak to many people where English is their second language or do not speak English at all. With no translators available at the company I work for, it can be frustrating to just let those people go because we are unable to help them get the help they may need.

This brings me to the headset translator. Using an AI program, users will be able to use AI voices to translate what is being said to them as well as communicating back to the customer on the line. With the use of a button/foot pedal, callers would be able to determine when they would like to have what they are saying be translated. This program would also be able to detect what language is being spoken and automatically reply in said language.

This program would solve the frustrations of language barriers and get those in need the help they need without needing a physical translator.
